

RESERVOIRS
A QUICK DIP
A QUICK DEATH

northern ireland
water

Delivering what matters

Swim in a reservoir and you could end up dead. It's that simple. You might think you can handle it. That you're a strong enough swimmer.

But once the cold takes hold - and it happens in seconds - you lose control. A couple of seconds more, you lose your life.

TEMPERATURE

Reservoir water is very deep and dangerously cold.

TIME

If you get into difficulty, it will be too late.

STRONG CURRENTS

Underwater currents sweep you away and pull you under.

WEATHER CONDITIONS

It's cold in summer. Freezing in winter. Ice gets thinner the further you go in. When the ice breaks, you'll not survive.

DISEASES

Animals that can access open water carry fatal diseases.

ALCOHOL

If you're drunk, you'll drown.

UNDER WATER

Machinery, weeds, rubbish and plants will drag you under.

**WHY TAKE THE RISK AT RESERVOIRS?
WISE UP.
IT'S JUST NOT WORTH IT.**
